Manager's commentary

(as at 30/04/14)

European markets eked out further gains in April, bringing them close to new 12-month highs. The euro continued to strengthen, bringing further modest disinflationary pressure, but the European Central Bank made a statement in which it said that it is "unanimous in its commitment to using also unconventional instruments within its mandate to cope effectively with risks of a too prolonged period of low inflation." The economic recovery continued, with the composite eurozone purchasing managers' index exceeding expectations, with both services and manufacturing contributing to the rise.

The trust's share price outperformed the benchmark, while the net asset value underperformed, as the market rotated into less economically-sensitive stocks, and as financials paused in their recent uptrend. Events in Ukraine continued to cast a shadow, and the earnings backdrop remained fairly weak. Towards the end of 2013 we bought some unfashionable but attractively-valued shares in the utilities and telecoms area, and also raised our exposure to energy stocks. This helped our performance in April, as these sectors performed positively during the market's rotation. Our gearing also helped, as markets rose to within touching distance of new highs.

Market Outlook

Lead indicators for earnings and margins suggest that they will resume growth this year. The background remains constructive. Portugal has announced plans to access market funding again, and the reform programme of Matteo Renzi in Italy—while ambitious—seems to be receiving widespread popular support. Even Greece is forecast to achieve a primary surplus this year. While we wait for earnings to grow, though, we may well see a continuation of range-bound markets.

JPMorgan European Investment Trust plc - Growth Shares

Investment trust history and investment policies

JPMorgan European Investment Trust plc was formed in 1929 as The London and Holyrood Trust Limited and was a general investment trust until 1982 when the name was changed to The Fleming Universal Investment Trust. Under this name the portfolio became more internationally invested until November 1988, when the Board decided to concentrate on Continental European investments. In 1992 shareholders approved a formal adoption of this specialisation. The Company adopted its current structure and name in August 2006.

The Company has two share classes, each with distinct investment policies, objectives and underlying asset pools. Each share class is listed separately and traded on the London Stock Exchange. This capital structure means that shareholders may benefit from greater investment flexibility in a tax-efficient manner.

Capital growth from Continental European investments, by consistent out-performance of the benchmark and a rising share price over the longer term by taking carefully controlled risks through an investment method that is clearly communicated to shareholders.

Explanatory Notes, Risks and Important Information

Notes

^ACapital only NAV with debt at par, diluted for treasury and/or subscription shares if applicable.

^BDividend yields are based on mid market prices and the estimated dividend(s) payable in respect of the current financial year. This will include declared and prospective dividends. Source Morningstar

^CActual gearing: Represents the excess amount above shareholders' funds of total assets less cash/cash equivalents, expressed as a percentage of shareholders funds. If the amount calculated is negative, this represents a net cash position.

^DOngoing charges are the management fee and all other operating expenses, excluding interest charges on any borrowing and any performance fee payable expressed as a percentage of the average daily net assets during the year. All figures are for the previous financial year.

^EPrior to 01/08/06 the performance record is of the predecessor company J.P.Morgan Fleming Continental European Investment Trust plc.

^FOn 26/03/13 the benchmark for the Trust was changed from FTSE All World Developed Europe (ex UK) Index to MSCI Europe ex UK Index.

^GNet asset value assumes that shares held in treasury (if any) have been re issued at the previous nights closing price.

^HBased on total investments, which include investment of any borrowings to gear the portfolio and excludes liquidity fund holdings and net current assets.

See Glossary of terms for explanations.

Risk Information

The value of investments and the income from them may fall as well as rise and investors may not get back the full amount invested.

Investment trusts may borrow to finance further investment (gearing). The use of gearing will increase the volatility of movements in the Net Asset Value (NAV) per share. This means that a relatively small change, down or up, in the value of a trust's assets will result in a magnified fall or rise, in the same direction, of the investment trust's NAV per share. Exchange rate changes may cause the value of underlying overseas investments to go down as well as up. The trust may invest in smaller company shares, which can be more unpredictable and less liquid than shares of larger companies. Where permitted, a trust may invest in other investment trusts that utilise gearing (borrowing), which will exaggerate market movements both up and down.

Glossary of terms

Annual volatility: Volatility is one measure used to assess the risk of a portfolio as it helps to describe the likely range of returns achieved by the fund. In statistical terms it is the standard deviation of the return distribution. Greater volatility of monthly Net Asset Value returns means that there is a wider range of likely returns in the future, or greater uncertainty regarding the fund return. Most investors would equate this greater uncertainty with greater risk. Gearing will have an impact on the volatility of an investment trust.

Benchmark comparison: Comparison of the Company's performance is made with the benchmark. The benchmark is a recognised index of stocks which should not be taken as wholly representative of the Company's investment universe. The Company's investment strategy does not follow or track this index and therefore there may be a degree of divergence between its performance and that of the Company.

Cash: Net current assets and includes investment in liquidity funds & treasury stocks (if held) and drawn revolving credit facilities (if any) with an original maturity of less than 1 year.

Correlation: Correlation describes the way in which Net Asset Value has moved relative to the benchmark. Correlation coefficients range between +1.0 for assets which consistently move in the same direction, and -1.0 for assets which consistently move in the opposite direction. Assets with a correlation of zero are unrelated. Portfolios combining assets with low correlations provide diversification or risk reduction benefits, potentially without decreasing total portfolio return.

Actual gearing: Total portfolio less liquidity stocks, divided by net assets plus income cash and any effects of performance fees and revenue reserve accruals where applicable.

Gearing range: Indication of the maximum and minimum percentage by which the Company may be geared.

Information ratio: This is the difference between the annualised average fund return and the annualised average benchmark return (calculated geometrically) divided by the annualised tracking error. The higher the ratio, the better, as it shows that the risk taken by the fund manager relative to the benchmark has been rewarded. Gearing will have an impact on the information ratio.

Sector/Geographical breakdowns: These are expressed as a percentage of total portfolio and cash. Investments in liquidity funds will be shown as cash.

Top 10 holdings: These are expressed as a percentage of total portfolio and cash. Investments in liquidity funds / treasury stocks will not be shown in the top 10 holdings.

Ongoing charges: The ongoing charges represent the Company's management fee and all other operating expenses, excluding finance costs and any performance fee payable, expressed as a percentage of the average daily net assets during the year.

Tracking error: Tracking error measures the standard deviation of relative returns, i.e. the Net Asset Value return less the benchmark return. Tracking error is often used as a measure of risk taken against the fund's benchmark with a larger tracking error indicating that greater risks were taken relative to the benchmark in achieving the return of the fund. Gearing will increase a tracking error.
