Characteristics

Number of holdings: Debt issues	28
Duration (years)	17.39
Weighted average life (years)	27.62
Yield to worst (%)	4.32

Credit quality of fixed income holdings (%)	Fund	Index
AA	98.31	100.00

Bond credit quality ratings provided by Janus Henderson Investors is based on the average of ratings from Moody's, Standard & Poor's and Fitch where all three agencies have provided a rating. If only two agencies rate a security, the average is on those. If only one agency rates a security, that rating is used. Ratings are measured on a scale that ranges from AAA (highest) to CCC (lowest). Swaps, Options, Cash and Bond Futures are separately grouped.

Maturity of fixed income holdings (%)	Fund	Index
15+ years	98.31	100.00

Fees & charges (%)

Annual management charge (AMC)	0.50
Ongoing charge (OCF)	0.71

All ongoing charges stated are as per latest published report and accounts.

Fund charges will impact the value of your investment. In particular, the ongoing charges applicable to each fund will dilute investment performance, particularly over time. For further explanation of charges please visit our Fund Charges page at www.janushenderson.com.

Under some circumstances initial charges may apply. Please refer to the Prospectus for more details.

Additional fund information

Tax assumptions and reliefs depend upon an investor's particular circumstances and may be subject to change. Please note the performance target is to be achieved over a specific annualised time period. Refer to the performance target wording within the objective. From 01 November 2022, Andrew Mulliner and Bethany Payne no longer manage this fund. Helen Anthony now manages this fund. Fund size at 12pm on last business day of month. Please note: due to rounding the figures in the holdings breakdowns may not add up to 100%. Performance for the share class is calculated at 12pm and performance of the index is calculated as at close of business. Note that any differences among portfolio securities currencies, share class currencies and costs to be paid or represented in currencies other than your home currency will expose you to currency risk. Costs and returns may increase or decrease as a result of currency and exchange rate fluctuations. FTSE Gilts (over 15yrs) Total Return Index redistributed and FTSE® used under licence from FTSE. FTSE and its licensors Financial Times Limited and London Stock Exchange plc own all rights therein and disclaim liability for errors/omissions. All credit, country and sector breakdowns relate to end of day trading positions. The month-end duration of the fund (in years) is shown on page 2. Duration measures the sensitivity of a bond fund to interest rate changes; the larger the figure, the more sensitive is the bond fund to a movement in interest rates. Interest Rate Swaps are an agreement between two parties where one stream of future interest payments is exchanged for another based on a specified principal amount. Interest rate swaps often exchange a fixed payment for a floating payment that is linked to an interest rate (most often the LIBOR). The use of interest rate swaps is to limit or manage exposure to fluctuations in interest rates, or to obtain a marginally lower interest rate than it would have been able to get without the swap. Investment into the fund will acquire units/shares of the fund itself and not the underlying assets owned by the fund. Cash balances and exposures are based on settled and unsettled trades as at the reporting date.

The FTSE Actuaries UK Conventional Gilts greater than 15 years to maturity Index is a measure of the combined performance of bonds issued by the British government with more than 15 years to maturity. It forms the basis of the Fund's performance target and provides a useful comparison against which the Fund's performance can be assessed over time.

The Investment Association (IA) groups funds with similar geographic and/or investment remit into sectors. The Fund's ranking within the sector (as calculated by a number of data providers) can be a useful performance comparison against other funds with similar aims.

Investment policy

The Fund invests at least 80% of its assets in UK government bonds (also known as gilts), typically with maturities of 15 years or more. (Longer dated bonds are generally more sensitive to changes in interest rates and may at times exhibit significant volatility.) The Fund may also hold other assets including bonds of other types from any issuer, Collective Investment Schemes (including those managed by Janus Henderson), cash and money market instruments. The Investment Manager may use derivatives (complex financial instruments) with the aim of making investment gains in line with the Fund's objective, to reduce risk or to manage the Fund more efficiently. The Fund is actively managed with reference to the FTSE Actuaries UK Conventional Gilts greater than 15 years to maturity Index, which is broadly representative of the bonds in which it may invest, as this forms the basis of the Fund's performance target. The Investment Manager has discretion to choose investments for the Fund with weightings different to the index or not in the index. As an additional means of assessing the performance of the Fund, the IA UK Gilt sector average, which is based on a peer group of broadly similar funds, may also provide a useful comparator.

Investment strategy

The Investment Manager aims to provide a return in excess of the benchmark by investing primarily in long maturity UK government bonds, including inflation-linked gilts and floating rate assets. The managers can also invest in other global fixed income securities with a focus on G10 government bond markets and associated fixed income derivatives, with the aim of providing diversification in the portfolio, as well as looking to enhance returns and/or manage risk.

Fund specific risks

The Fund could lose money if a counterparty with which the Fund trades becomes unwilling or unable to meet its obligations, or as a result of failure or delay in operational processes or the failure of a third party provider. When interest rates rise (or fall), the prices of different securities will be affected differently. In particular, bond values generally fall when interest rates rise or are expected to rise. This is especially true for bonds with a longer time to maturity. A high portion of this fund is invested in longer maturity bonds and so rising interest rates can pose a significant risk to capital. An issuer of a bond (or money market instrument) may become unable or unwilling to pay interest or repay capital to the Fund. If this happens or the market perceives this may happen, the value of the bond will fall. If a Fund has a high exposure to a particular country or geographical region it carries a higher level of risk than a Fund which is more broadly diversified. The Fund may use derivatives to help achieve its investment objective. This can result in leverage (higher levels of debt), which can magnify an investment outcome. Gains or losses to the Fund may therefore be greater than the cost of the derivative.

Derivatives also introduce other risks, in particular, that a derivative counterparty may not meet its contractual obligations. Securities within the Fund could become hard to value or to sell at a desired time and price, especially in extreme market conditions when asset prices may be falling, increasing the risk of investment losses.

Glossary

Distribution Yield

The Distribution Yield reflects the amounts that may be expected to be distributed over the next 12 months as a percentage of the mid-market share price of the fund at the date shown.

Duration

How far a fixed income security or portfolio is sensitive to a change in interest rates, measured in terms of the weighted average of all the security/portfolio's remaining cash flows (both coupons and principal). It is expressed as a number of years. The larger the figure, the more sensitive it is to a movement in interest rates. 'Going short duration' refers to reducing the average duration of a portfolio. Alternatively, 'going long duration' refers to extending a portfolio's average duration.

Gilts

British government bonds sold by the Bank of England, done to finance the British national debt.

Option

A derivative instrument where one party pays/receives the total return of the underlying asset or market index, in exchange for payments typically linked to LIBOR.

Swaps

A derivative contract between two parties where pre-determined cash flows of two financial instruments are exchanged. Swaps can help to hedge risk and minimise uncertainty; for example currency swaps can be used to minimise foreign currency exposure.

Tracking error

This measures how far a portfolio's actual performance differs from its benchmark index. The lower the number, the more closely it resembles the index.

Underlying Yield

The Underlying Yield reflects the annualised income net of expenses of the fund (calculated in accordance with relevant accounting standards) as a percentage of the mid-market share price of the fund at the date shown.

Weighted Average Life (WAL)

The average time taken (in years) for the principal to be repaid for securitised assets, or the probable time to maturity for non-securitised assets. Securitised assets, also known as 'asset backed' securities, represent a pool of other interest bearing assets such as loans and mortgages. The value is based on the cash flows of the underlying assets.

Yield to worst

If a bond has special features, such as a call (ie, the issuer can call the bond back at a date specified in advance), the yield to worst is the lowest yield the bond can achieve provided the issuer does not default.
